

Options to protect your TORRENT 2 from frost (remember frost can cause serious damage to your machine).

Option 1:

1. Leave a small amount of water in the main water tank and add a 50/50 automotive blend antifreeze (anti-freeze that you use in your vehicle radiator – not what you use in your windscreen liquid)
2. Start your machine, pull the trigger gun, and run the antifreeze through your pressure washer and into the pump and coil until you see green coming out the nozzle.
3. The antifreeze will protect inside metal wetted surfaces, packings, and plungers in the pump to your coil.
4. Also, quickly open and shut your trigger several times to get antifreeze into your bypass line.
5. Lastly, you can blow out the antifreeze into a bucket or container or leave it in the machine until you need to use it again.
6. Remember: Make sure all pressure is released out the system when the machine is switched off.

Option 2:

1. Drain the main tank from (17)
2. Open the filter (14) and drain the water
3. Disconnect the Trigger (9), lance (8) and high-pressure hose (7) and drain the water out of all of these.
4. Start the engine and run for 30sec (this will drain the pump of excess water).
